Faculty of Computers and Artificial Intelligence

Project Summary:

With access to the dataset provided in the next section,

- Download and analyze the dataset.
- Start working through the steps outlined in the requirements section.

Dataset:

Handwritten Alphabets (hyperlink)

The dataset contains greyscale images for 26 (A-Z) handwritten alphabets of size 28*28 pixels. Your goal is to classify them.

Requirements:

• Data exploration and preparation:

- o Identify the number of unique classes and show their distribution.
- o Normalize each image.
- o Reshape the flattened vectors to reconstruct and display the corresponding images while testing the models.

• Experiments and results:

- o Split the data into training and testing datasets
- o First experiment (You can use scikit-learn):
 - Train 2 SVM models with linear and nonlinear kernels.
 - Test the models and provide the confusion matrix and the average f-1 scores for the testing dataset.
- o Split the training dataset into training and validation datasets.
- o Second experiment (Build from scratch):
 - Implement logistic regression for one-versus-all multi-class classification.
 - Train the model and plot the error and accuracy curves for the training and validation data.
 - Test the model and provide the confusion matrix and the average f-1 scores for the testing dataset.

Faculty of Computers and Artificial Intelligence

- o Third experiment (You can use TensorFlow):
 - Design 2 Neural Networks (with different number of hidden layers, neurons, activations, etc.)
 - Train each one of these models and plot the error and accuracy curves for the training data and validation datasets.
 - Save the best model in a separated file, then reload it.
 - Test the best model and provide the confusion matrix and the average f-1 scores for the testing data.
 - Test the best model with images representing the alphabetical letters for the names of each member of your team.
- o Compare the results of the models and suggest the best model.

Deliverables:

You are required to submit ONE zip file containing the following:

- Your code (.py) file. If you have a (.ipynb) file, you have to save/download it as (.py) before submitting.
- A report (.pdf) containing the team members' names and IDs, the dataset you chose and the code with screenshots of the output of each part. If you have a (.ipynb) file, you can just convert it to pdf.

The zip file must follow this naming convention: Group_ID1_ID2_ID3_ID4_ID5_ID6

Instructions:

- 1. The minimum number of students in a team is 3 and the maximum is 6.
- 2. No late submission is allowed.
- 3. All team members must understand all parts of the code.
- 4. Stick to uploading ONLY the required files following the naming convention.
- 5. Cheating students will take **ZERO** and no excuses will be accepted.
- 6. Grades are given based on the performance of the team in the presentation and satisfying the requirements.

Grading Criteria:

Data Preparation	2
SVM	2
Logistic Regression	3
Neural Networks	3
Results in a well-written report	1
Total = 11 points
